The global Negative Photoresist Remover market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Negative photoresist is a material used in lithography processes in microelectronics manufacturing. It usually requires steps such as photolithography, exposure, and development to form fine patterns. During the photolithography process, there may be some defective patterns or residual photoresist, and negative photoresist removers need to be used to remove them. Negative photoresist remover is usually an organic solvent that can effectively remove negative photoresist.
