Negative pressure drainage membrane is a medical membrane used for wound care. Its design objective is to create a sealed environment on wounds undergoing negative pressure wound therapy (NPWT). NPWT is a technique for aspirating wounds to promote healing. Place a special dressing on the wound and use a vacuum pump to generate negative pressure, which helps remove excess fluid and promotes blood flow to the area. Negative pressure drainage film is used to form a seal around the dressing, preventing air from entering and damaging the negative pressure environment.

Negative pressure drainage membranes are usually made of thin transparent materials, such as polyurethane or silicone. Its design has a high degree of flexibility and adaptability, making it conform to the contours of the body. The film also has strong adhesion, ensuring that it remains in place during movement and activity. Overall, negative pressure drainage membranes are an important component of NPWT, helping to create a sealed environment that promotes healing and prevents infection.
