Abstracts

The global Nematode Control Pesticides market size is expected to reach \$ 1829.2 million by 2029, rising at a market growth of 3.2% CAGR during the forecast period (2023-2029).

Nematodes are the most abundant multicellular animals on the earth, and nematodes exist wherever there is water on the earth. Among them, plant parasitic nematodes account for 10%, and they cause harm to plant growth through parasitism, which is one of the important factors that cause major economic losses in agriculture and forestry. In field diagnosis, soil nematode diseases are easily confused with element deficiency, root cancer, clubroot, etc., leading to misdiagnosis or untimely control. In addition, root wounds caused by nematode feeding provide opportunities for the occurrence of soil-borne diseases such as bacterial wilt, blight, root rot, damping-off, and canker, resulting in compound infections and further increasing the difficulty of prevention and control.

Nematodes have become an important class of plant pathogens
