## Abstracts

The global Neonatal PICC Catheter market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Neonatal PICC (Peripherally Inserted Central Catheter) catheter refers to a type of catheter that is specifically designed and used in the neonatal intensive care unit (NICU) to deliver intravenous medications, fluids, and nutrients directly into the central circulation.

This catheter is peripherally inserted, meaning it is inserted into a peripheral vein (such as the arm or leg) and then advanced through the vasculature until the tip reaches a central vein near the heart, typically the superior vena cava. The catheter is held in place by an adhesive securement device.

Neonatal PICC catheters have a small diameter to minimize the risk of complications such as phlebitis and deep vein thrombosis. They are made of biocompatible materials like polyurethane or silicone, which are flexible and allow for ease of insertion and maintenance. The catheter is typically 1 to 3 French (Fr) in size, with the length varying depending on the location of the central vein.

The proximal end of the Neonatal PICC catheter is equipped with multiple ports or lumens, allowing for simultaneous administration of different medications or fluids. These ports are also used for blood draws and monitoring of central venous pressure. The distal end is radiopaque to aid in the positioning and confirmation of the correct catheter tip location on imaging.

Neonatal PICC catheters are used in premature infants or critically ill neonates who

require long-term intravenous access. They provide a safe and efficient means of delivering medications and fluids, reducing the need for multiple peripheral venipunctures and minimizing the risk of infection and vascular damage in these vulnerable patients.
