Abstracts

The global Neonatal Seizures Drug market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Seizures in neonates are aberrant electrical discharges in the central nervous system that typically appear as stereotyped muscle activity or autonomic abnormalities. Electroencephalography confirms the diagnosis, and further testing for reasons is recommended. Treatment is determined by the underlying cause. Seizures affect up to 1.4 percent of full-term new-borns and 20% of premature infants. Seizures could be a sign of a significant neonatal condition that has to be evaluated right away. The lack of myelination and insufficient creation of dendrites and synapses in neonates prevents generalization of electrical activity, hence most neonatal seizures are focal.

This report studies the global Neonatal Seizures Drug production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Neonatal Seizures Drug, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
