The network decoding matrix is ??a device used for decoding and distributing video signals. It can receive video streams of different formats transmitted over the network, and distribute them to multiple display devices after decoding to achieve simultaneous display and management of multiple videos. It can monitor multiple video sources in real time and provide flexible signal switching and routing. The network decoding matrix supports decoding of HD to ultra-HD videos (including 4K and 8K) and can be remotely controlled and managed through network protocols (such as TCP/IP and UDP). Its main features include efficient decoding capabilities, wide range of video format support, remote operation, and high-quality processing of HD video signals. It is suitable for use in systems that require large-scale video display and management.
