According to our (Global Info Research) latest study, the global Network Interface Board (NIB) market size was valued at US\$ 7110 million in 2025 and is forecast to a readjusted size of US\$ 11254 million by 2032 with a CAGR of 6.7% during review period.

A Network Interface Board (NIB) is a hardware module used in industrial control systems, computers, or embedded devices to enable network communication between the main controller (such as an industrial PC, PLC, or robot controller) and external networks or devices. It typically provides one or multiple communication interfaces such as Ethernet, fieldbus (e.g., EtherCAT, PROFINET, CAN), or other industrial communication protocols, allowing high-speed and reliable data exchange. In 2025, global Network Interface Board production reached approximately 37.35 M pcs, with an average global market price of around US\$ 185 per pc. Annual production capacity is 41 M pcs. Gross Profit Margin: 38%. The Network Interface Board (NIB) industry chain is structured across three main layers: upstream semiconductor and electronic component suppliers, midstream module and board manufacturers, and downstream system integrators. Upstream includes Ethernet PHY chips, communication controllers, PCB substrates, and industrial connectors, primarily supplied by companies like Intel, Broadcom, and various PCB manufacturers. Midstream consists of industrial automation and embedded hardware companies that design and produce network interface boards, protocol modules, and industrial communication cards. Downstream applications include PLC systems, industrial robots, edge computing devices, and smart factory equipment, where NIBs serve as the key communication bridge enabling real-time data exchange and system integration. Network Interface Board is becoming a foundational component of intelligent industrial systems rather than a standalone

hardware product. Its value is increasingly driven by real-time communication performance, protocol compatibility, and system-level integration rather than hardware cost alone. As automation, robotics, and industrial IoT continue to expand, demand is shifting toward higher-speed, multi-protocol, and more embedded network interfaces, making this market moderately growing but highly tied to ecosystem standards.
