## Abstracts

The global Neuromyelitis Optica Drug market size is expected to reach \$ 64.33 million by 2032, rising at a market growth of 2.9% CAGR during the forecast period (2026-2032).

Neuromyelitis optica (NMO) is an uncommon disease syndrome of the central nervous system (CNS) that affects the optic nerves and spinal cord. Individuals with NMO develop optic neuritis, which causes pain in the eye and vision loss, and transverse myelitis, which causes weakness, numbness, and sometimes paralysis of the arms and legs, along with sensory disturbances and loss of bladder and bowel control. NMO leads to loss of myelin, which is a fatty substance that surrounds nerve fibers and helps nerve signals, move from cell to cell. The syndrome can also damage nerve fibers and leave areas of broken-down tissue. In the disease process of NMO, for reasons that aren't yet clear, immune system cells and antibodies attack and destroy myelin cells in the optic nerves and the spinal cord. Neuromyelitis optica drug is drug used in the treatment of neuromyelitis optica, in this report we focused on Glucocorticoids such as Methylprednisolone and Immunoglobulin such as IVIg.

The Neuromyelitis Optica (NMO) drug market is being significantly driven by the rising prevalence and improved diagnosis of this rare autoimmune disorder, also known as Neuromyelitis Optica Spectrum Disorder (NMOSD). Increased awareness among healthcare professionals, coupled with advancements in diagnostic technologies such as AQP4-IgG antibody testing, has led to earlier and more accurate diagnosis of NMO, thereby increasing the number of patients eligible for treatment. Furthermore, the approval of targeted therapies like eculizumab, inebilizumab, and satralizumab in recent years has transformed the treatment landscape, offering more effective and specific interventions compared to traditional immunosuppressants. These breakthroughs have

not only improved patient outcomes but have also stimulated investment and innovation in NMO drug development. The growing focus on orphan diseases by pharmaceutical companies, supported by favorable regulatory incentives such as orphan drug designations and fast-track approvals, is further fueling market growth. In addition, increasing healthcare expenditure, especially in developed regions, and a stronger patient advocacy movement are contributing to greater access to treatment and awareness about this once-overlooked condition.

Despite promising developments, the NMO drug market faces several challenges that may hinder its long-term growth. First, the high cost of newly approved biologic therapies poses a significant barrier to access, particularly in low- and middle-income countries where reimbursement systems are weak or nonexistent. The pricing of drugs like eculizumab, which can cost hundreds of thousands of dollars per year, places a heavy burden on both healthcare systems and patients, potentially limiting widespread adoption. Additionally, NMO is a rare and complex disease, which makes it difficult to recruit sufficient participants for large-scale clinical trials, slowing the pace of drug development and innovation. The heterogeneity of disease presentation and overlapping symptoms with multiple sclerosis also pose diagnostic challenges, which can lead to misdiagnosis and inappropriate treatment. Moreover, long-term safety data for newer therapies are still limited, which may create hesitation among clinicians and regulatory bodies when adopting these treatments on a broader scale. Lastly, the market remains highly specialized, with few pharmaceutical players involved, leading to limited competition and potential supply chain vulnerabilities. Addressing these issues will be essential to ensuring that recent advancements in NMO treatment translate into improved outcomes for patients across different healthcare environments.
