Abstracts

The global Neurosurgical Patch market size is expected to reach \$ 1332 million by 2032, rising at a market growth of 5.9% CAGR during the forecast period (2026-2032).

A neurosurgical patch is used to repair defects or wounds in the brain, spine, or nervous system. These patches are often used in cranial surgeries, spinal surgeries, or to repair cerebrospinal fluid (CSF) leaks. They can be made from synthetic materials, biologic materials, or a combination of both, and are designed to support the healing process and prevent complications such as infection or scarring.

In 2025, global sales of Neurosurgical Patch reached approximately 2,127 K Pcs, with an average global market price of around US\$ 406/Pcs. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 80% to 95%.

The increasing prevalence of neurological disorders, such as brain tumors, spinal cord injuries, and degenerative diseases, is driving demand for neurosurgical patches. The trend toward minimally invasive surgeries in neurosurgery also fuels the need for innovative and effective patch technologies.

Advancements in biomaterials, such as tissue-engineered patches, provide significant opportunities for the market. The rise in spinal surgeries and cranial procedures, driven by aging populations and increased incidence of neurological disorders, further expands market potential.

The high price of neurosurgical patches limits their use in resource-limited settings. Regulatory challenges associated with approval processes and the risk of complications

such as infection and tissue rejection are also barriers.

Increasingly, the market is seeing a shift toward biomimetic materials that support the regeneration of nervous tissue and promote faster recovery. There is also a growing trend of personalized medicine, where patches are tailored to individual patients' needs.

This report studies the global Neurosurgical Patch production, demand, key manufacturers, and key regions.
