Abstracts

NSSC (Neutral Sulfite Semi Chemical) pulping is a type of semi-chemical pulping process to produce unbleached pulp at yields of around 80%. Hardwoods are normally used as raw material and the produced pulp is mainly used for production of corrugating medium (fluting). Chips are impregnated with sulfite and carbonate at neutral pH, cooked for about 30 minutes at around 170-180 °C, defibrated to coarse pulp in a refiner, washed and finally refined to obtain an optimum combination of strength and stiffness. The total specific energy consumption in defibration and refining is normally less than 200 kWh/t. The spent liquor is normally sent to a kraft mill for recovery of chemicals and heat (cross-recovery).
