## Abstracts

Most of the infants are born normal and healthy at the time of birth and with no family history of disorders. Unfortunately, once symptom appears in child, they are often irreversible leading to severe health and developmental problems. Newborn screening helps in identifying diseases, which can affect a child's health in the long run, at an early stage. Newborn screening, which includes a series of tests, is essential for early detection, diagnosis, and management, to prevent disability and death of a child. These tests, which are performed shortly after the birth of a baby, are used for the detection of genetic, developmental, and metabolic disorders in newborn babies.
