The new display device testing equipment is mainly used for the optical characteristics, display defects, electrical characteristics and other functional detection and calibration repair of the Cell and Module processes of new display devices such as AMOLED and TFT-LCD. It is used for product defect detection, product grade judgment and Classification, calibration, repair and re-judgment of some product defects, so as to improve product yield, reduce production loss, and provide data support for process improvement of related processes.

According to data from CODA, the General Administration of Customs and CCID, in 2021, the scale of the global electronic information industry was about US\$10 trillion, of which the new display production capacity was about 350 million square meters, and the industry scale was about US\$150 billion, the scale of the whole industry chain was about US\$250 billion. The flat panel display (FPD) industry is mainly concentrated in South Korea, Japan, Taiwan, and mainland China. Among them, mainland China is the largest panel production and manufacturing base as well as a research and development application center. In 2021, China flat panel display production capacity exceeded 200 million square meters, accounting for about 60% of the global production capacity. The shipping area was about 160 million square meters, which was about 63.3% of the world. The industry scale was about \$90 billion, accounting for about 36.9% of the world. The sales volume was about \$64.8 billion, and the total share was

about 41.5%. In terms of the entire industry chain, the proportion of China's upstream display professional materials output value is also gradually increasing, accounting for 28.5% of the global total in 2021.
