Newborn screening is the practice of testing every newborn harmful or potentially fatal disorder that is not otherwise apparent at birth.

Newborn screening identifies conditions that can affect a child's long-term health or survival. This screening technology includes a series of tests essential for timely detection, early diagnosis, and health management to prevent overall disability and avert death of a child. These tests are performed shortly after the baby is born, and detect genetic, developmental, and metabolic disorders in newborn babies and are tested for hearing loss and critical congenital heart defects (CCHDs) prior to discharge from a hospital or birthing center.

In this report, we study the instruments used in newborn screening.
