## Abstracts

The global Next Generation Airport Management market size is expected to reach \$ 5763 million by 2032, rising at a market growth of 4.7% CAGR during the forecast period (2026-2032).

Next Generation Airport Management refers to a modern, data-centric approach and software stack for running airports as real-time, collaborative ecosystems rather than siloed departments. It typically combines an Airport Operational Database (AODB) as the single source of truth for flight/turnaround events with modules for resource management (gates, stands, belts, check-in, staff/equipment), Airport CDM/A-CDM for cross-stakeholder decision-making, and an Airport Operations Center (APOC/AOCC) layer for situational awareness and disruption recovery. Compared with legacy systems, ?next generation? solutions emphasize cloud delivery, open APIs, event-driven integration, predictive analytics/AI (e.g., more accurate off-block and in-block predictions), and unified operational dashboards that connect airlines, ground handlers, ATC, and airport teams. The objective is to improve on-time performance, capacity utilization, and resilience while supporting compliance, auditability, and sustainability reporting through consistent operational data and automated workflows.

The Next Generation Airport Management market is experiencing significant growth and transformation as airports worldwide seek to modernize their operations, enhance passenger experience, and improve overall efficiency. Advanced technologies such as artificial intelligence, big data analytics, Internet of Things (IoT), automation, and cloud computing are driving the development and adoption of Next Generation Airport Management solutions. These technologies enable airports to optimize operations, improve decision-making, and provide personalized services to passengers.
