Abstracts

The global Next-generation Panama Power Supply for Data Center market size is expected to reach \$ 28400 million by 2032, rising at a market growth of 84.6% CAGR during the forecast period (2026-2032).

The Next-generation Panama Power Supply for Data Center is a high-reliability modular power supply solution in the data center power distribution field. In essence, it is a power system architecture based on high-voltage direct current (HVDC) power supply or modular rectification power conversion, designed to replace the traditional multi-stage AC power architecture of “UPS + power distribution + rack-level power supply.” It achieves this by performing centralized rectification or modular conversion on the power side, directly delivering high-voltage DC power to IT loads, thereby reducing the number of energy conversion stages.

The core concept of this architecture is to shorten the power delivery chain by compressing the traditional multi-stage AC conversion process into a streamlined structure: “utility input – power module rectification/conversion – DC bus or row-level distribution – IT load.” By eliminating UPS inversion and multiple AC/DC conversion steps, the overall power efficiency is typically improved, while system complexity and potential failure points are reduced.

Such power systems are usually designed with a modular architecture, supporting power module redundancy, hot-swappable expansion, and distributed monitoring and management. This allows flexible capacity scaling in response to growing data center loads. It is particularly well-suited for high-density computing scenarios such as AI servers and GPU clusters, enabling higher rack power density while improving overall

power stability.
