## Abstracts

The rising world population has resulted in an increase in the demand for food, while there has been an increase in the loss of crop and livestock-based food due to genetic concerns and climatic factors. The world population is expected to reach 9.7 billion by 2050, which further stresses on the need to employ advanced technologies so that we can ensure sustainable productivity growth in agriculture. Agrigenomics provides an effective solution to the rising concerns by improving the productivity factor of the farmers. Agrigenomics helps the farmers, breeders, and researchers in identifying the genetic sequences which can be used to determine desirable traits and make better breeding decisions.

Scope of the Report:

With food security gaining increased importance in the worldwide scenario, the government of various countries across the globe are promoting the use of technologies like genomics and sequencing in the field of agriculture. The process of relating the agriculturally important characteristics like meat quality with one or more genes is important for ensuring better farm-outputs. Agrigenomics also helps in improving aquaculture, where desirable characteristics like disease resistance, and increased stress tolerance can be induced in the aquatic organisms.

The global NGS In Agrigenomics market is valued at xx million USD in 2017 and is expected to reach xx million USD by the end of 2023, growing at a CAGR of xx% between 2017 and 2023.
