Abstracts

According to our (Global Info Research) latest study, the global Nickel Deposits market size was valued at US\$ 9063 million in 2025 and is forecast to a readjusted size of US\$ 10557 million by 2032 with a CAGR of 2.0% during review period.

In 2025, global nickel deposits production reached 115.9 million tons, with an average selling price of US\$76 per ton. Nickel deposits refer to rich aggregates of nickel resources formed under geological processes that have economic exploitation value. They are non-ferrous metal deposits rich in nickel and possessing economic exploitation value. Currently, the two most economically viable and important types globally are laterite nickel deposits and sulfide nickel deposits. Nickel deposits themselves do not have end-use applications; what is truly utilized are the nickel ore, concentrates, and smelting products formed after mining, mainly concentrated in stainless steel, power batteries, high-temperature alloys, electroplating, catalysis, and chemical materials. The upstream sector includes geological exploration, resource assessment, mining, stripping, ore dressing, and concentrate transportation; the midstream sector involves pyrometallurgy, hydrometallurgy, and refining, with different process routes depending on the type of ore deposit; the downstream sector connects to stainless steel, nickel-based alloys, electroplating, catalysis, chemicals, and power battery materials. Gross profit margins range from approximately 15% to 35%.
