Abstracts

The global Night Vision Spectroradiometer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A night vision spectroradiometer is an instrument used to measure the spectral radiance received by night vision equipment (such as night vision goggles, infrared cameras, etc.). Night vision spectroradiometers measure the intensity of infrared radiation, visible radiation, and other wavelengths and display them as spectral graphs. Night vision spectroradiometers usually consist of a spectrometer, detector and data processing system. The spectrometer is used to decompose the received optical signal into spectra of different wavelengths, the detector is used to measure the radiance value at each wavelength, and the data processing system is used to process and analyze the measurement data and generate spectral graphics.
