According to our (Global Info Research) latest study, the global NMP Rotor Recovery System market size was valued at US\$ 1034 million in 2024 and is forecast to a readjusted size of USD 1911 million by 2031 with a CAGR of 9.3% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The NMP Rotor Recovery System mainly uses high concentration NMP gas to pass through the surface cooler, and the temperature drops to about 10 degrees. When NMP reaches saturation steam, the concentration decreases. The low concentration gas partially returns to the oven, and some passes through the rotary wheel before returning to the oven or being discharged. There is also a small amount that passes through the preheating area of the rotary wheel and then passes through the steam heat exchange area for heating. The heated gas is blown back by the rotary wheel to remove NMP from the rotary wheel (at this time, the air temperature reaches 200 °, and the saturated steam pressure increases significantly, which can adsorb more NMP steam. This rotary area is called the analysis area). The high concentration steam adsorbed NMP is recycled through the condenser to reduce the concentration.
