Non-aqueous PEDOT (poly(3,4-ethylenedioxythiophene)) is a conducting polymer that is synthesized and stabilized in a non-aqueous, organic solvent medium. It is also known as "solvent-based" PEDOT. Non-aqueous PEDOT has similar properties to aqueous PEDOT, including high conductivity and good processability, but it is used in applications that require higher performance, such as in organic electronics and energy storage devices. Non-aqueous PEDOT is typically synthesized using organic solvents like acetonitrile, chloroform, or methanol. However, the use of these solvents can be environmentally hazardous and may pose health risks to workers, which is why aqueous PEDOT is becoming a more popular alternative.
