Abstracts

Noise detection and monitoring products include noise dosimeters, noise monitors, and sound meters, which are used to measure and monitor excessive noise to control the noise levels. Noise is one of the most common occupational hazards, and exposure to high noise level can create psychological stress, reduce productivity, and cause hearing disabilities. Noise monitoring consists of real-time data transmission and dynamic noise maps, which store and transmit the noise levels of each location under observation to a central location.

Scope of the Report:

This report focuses on the Noise Detection and Monitoring in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. Operations at the manufacturing industries create loud noise due to vibrations from fans, vibrating panels, rotors, stators, turbulent fluid flow, impact processes, electrical machines, and internal combustion engines. Additionally, processes such as crushing, riveting, shake-out (foundries), punch presses, drilling, plasma jets, cutting torches, and sandblasting also produce harmful noise levels. To counter this, regular noise level inspections along with the adoption of hearing protection equipment is necessary, which demand the need for monitoring and measurement equipment.

The worldwide market for Noise Detection and Monitoring is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
