Non-absorbable self-locking suture is a surgical suture material with self-locking function that cannot be naturally degraded and absorbed in the human body. The suture is usually made of polymer synthetic materials, and the thread structure is designed with serrations or anchor hooks, which can achieve unidirectional fixation during the suturing process without the need for traditional knotting operations, thereby improving surgical efficiency and reducing the risk of suture failure. It is widely used in surgical fields that require long-term tissue support and stable sutures, such as plastic surgery, cardiothoracic surgery, and general surgery.
