Non-associated cellulose rheology modifier is a class of additives used to adjust the rheological properties of various water-based coatings (such as wall paints, wood paints, industrial coatings, etc.). Compared with traditional colloidal stabilizers or thickeners Compared with non-associated cellulose rheology modifiers have higher thickening ability and better rheological properties. The main function of this additive is to adjust the viscosity and fluidity of the paint by forming a certain three-dimensional network structure, thereby controlling the performance of the paint during construction. In addition, non-associated cellulose rheology modifiers also have the advantages of good leveling, adhesion and color stability.
