The global Non-cellular Baseband Chip market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Non-cellular baseband chip is an integrated circuit chip used for wireless communication, which is used to process and manage baseband functions such as modulation and demodulation, encoding and decoding, and signal processing of wireless signals. Unlike cellular baseband chips, non-cellular baseband chips are usually used in some specific wireless communication technologies and application scenarios. Non-cellular baseband chips can support a variety of wireless communication technologies, such as Bluetooth, Wi-Fi, Zigbee, RFID, etc. They are usually used in some short-range, low-power wireless communication applications, such as smart home, Internet of Things, sensor networks, etc. The design and functionality of non-cellular baseband chips depends on specific application requirements. They usually require low power consumption, small size, and high integration to meet the requirements of small devices. In addition, non-cellular baseband chips also need to support corresponding wireless communication protocols and standards to ensure interoperability with other devices. Non-cellular baseband chips play an important role in the field of wireless communication, promoting the development of smart home, Internet of Things and other applications. With the continuous advancement of wireless communication technology and the expansion of application scenarios, the demand for non-cellular baseband chips is also increasing. Therefore, chip manufacturers continue to carry out technological innovation and product upgrades to meet the needs of the market.
