According to our (Global Info Research) latest study, the global Non-Combustible Building Materials market size was valued at US\$ 23280 million in 2025 and is forecast to a readjusted size of US\$ 38700 million by 2032 with a CAGR of 7.6% during review period.

The fire-retardant performance of buildings and materials is categorized into three major groups: noncombustible, quasi-incombustible, and flame-retardant. Noncombustibility refers to the ability to withstand high temperatures for a certain period. It protects a building's interior structure by preventing flame spread for a specified duration, even under direct exposure to fire. Quasi-incombustibility has similar heat resistance to noncombustibility but doesn't meet the same duration criteria. Flame-retardant materials resist flames, limiting fire spread and ceasing combustion quickly in case of a fire.
