Abstracts

A solar collector is a device that collects and/or concentrates solar radiation from the Sun. These devices are primarily used for active solar heating and allow for the heating of water for personal use. These collectors are generally mounted on the roof and must be very sturdy as they are exposed to a variety of different weather conditions. The use of these solar collectors provides an alternative for traditional domestic water heating using a water heater, potentially reducing energy costs over time. As well as in domestic settings, a large number of these collectors can be combined in an array and used to generate electricity in solar thermal power plants.

SCOPE OF THE REPORT:

This report focuses on the Non-concentrating Solar Collector in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

In the non-concentrating type, the collector area (the area that intercepts the solar radiation) is the same as the absorber area (the area that absorbs the radiation). Flat plate collectors (FPC) and evacuated tube collectors (ETC) are non-concentrating type collectors. These collectors are mainly designed for solar hot water and industrial process heat applications which require energy delivery at temperatures in the range of 60-250 °C. These collectors use both diffuse and beam solar radiation and do not require tracking of the sun. They are mechanically simpler than concentrating collectors and require less maintenance.

The worldwide market for Non-concentrating Solar Collector is expected to grow at a

CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
