According to our (Global Info Research) latest study, the global Non-contact Laser Interferometer market size was valued at US\$ 65.9 million in 2024 and is forecast to a readjusted size of USD 86.9 million by 2031 with a CAGR of 4.0% during review period.

The non-contact laser interferometer works based on the laser interference phenomenon. It uses a stable laser as a light source and splits the laser beam into two paths through a precision optical system: one as a reference beam and the other as a measuring beam. When the measuring beam is irradiated onto the surface of the object being measured and reflected back, it will reunite with the reference beam to form interference fringes. The slight changes in these interference fringes reflect the displacement information of the object being measured, so that the length, shape, flatness, straightness, angle and other geometric parameters of the object can be accurately measured.
