According to our (Global Info Research) latest study, the global Non-contact Microscope market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Non-contact Microscope is a microscope that can obtain high-resolution imaging without direct contact with the sample surface. It uses the principles of optics, acoustics, and electromagnetics to image, scans or projects a certain signal onto the sample, and then obtains the shape, structure, composition and other information of the sample according to the characteristics of the signal such as reflection, scattering, and transmission. Compared with traditional microscopes, non-contact microscopes can avoid damage to samples caused by contact, and can also observe some samples that cannot be observed by traditional microscopes, such as thin films and nanomaterials.
