According to our (Global Info Research) latest study, the global Non-contact Polygraph market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Non-contact polygraph, also known as a remote polygraph or a computerized polygraph, is a type of lie detector test that measures physiological responses such as changes in heart rate, blood pressure, and respiration, without requiring physical contact with the person being tested.

During a non-contact polygraph test, sensors are attached to the person being tested, typically on the fingers, chest, and arm. The person is then asked a series of questions, and the sensors measure their physiological responses to each question. The results are analyzed by a computer program, which can indicate whether the person is telling the truth or not.

Non-contact polygraph tests are often used in situations where physical contact is not possible or practical, such as in remote locations or with people who are unable to travel. They are also used in situations where the person being tested may be uncomfortable with physical contact, such as survivors of sexual assault.
