Abstracts

The global Non-contact Polygraph market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Non-contact polygraph, also known as a remote polygraph or a computerized polygraph, is a type of lie detector test that measures physiological responses such as changes in heart rate, blood pressure, and respiration, without requiring physical contact with the person being tested.

During a non-contact polygraph test, sensors are attached to the person being tested, typically on the fingers, chest, and arm. The person is then asked a series of questions, and the sensors measure their physiological responses to each question. The results are analyzed by a computer program, which can indicate whether the person is telling the truth or not.

Non-contact polygraph tests are often used in situations where physical contact is not possible or practical, such as in remote locations or with people who are unable to travel. They are also used in situations where the person being tested may be uncomfortable with physical contact, such as survivors of sexual assault.

This report studies the global Non-contact Polygraph production, demand, key manufacturers, and key regions.
