A Non-Contact Resistance Measurements System is an advanced testing device that uses electromagnetic induction or other non-contact methods to measure the electrical resistance of materials without physically contacting them. This system eliminates the need for contact probes, which can damage sensitive surfaces or cause electrical shorts in some applications. Non-Contact Resistance Measurements are essential in industries such as semiconductors, printed circuit boards, and high-tech materials, where contact-based measurements can be problematic. These systems offer advantages such as increased accuracy, high-speed measurements, and the ability to test in-situ and under controlled environmental conditions.
