The non-contact slip ring is a device that uses electromagnetic coupling technology to achieve non-contact bidirectional transmission of electric energy and digital signals. It transmits the power input from the primary to the secondary through electromagnetic coupling, and provides power to the secondary equipment at the same time. In addition, the non-contact slip ring also provides a bidirectional serial digital signal channel for the control equipment between the primary and secondary, ensuring efficient transmission of signals and electric energy without physical contact, and is widely used in scenarios that require rotation and transmission of electric energy and data.
