A non-contact slit lamp front mirror is an optical device used in ophthalmology to examine the anterior part of the eye, including the cornea, iris, and lens. It is a reflective surface placed in front of the patient's eyes during the examination process. The design purpose of this mirror is to reflect the light emitted by the slit lamp onto the eyes without touching it, which is why it is called 'non-contact'. This allows doctors to examine the eyes without causing any discomfort or damage to the patient's eyes. Mirrors are usually made of high-quality glass or plastic and are designed to provide clear and distortionless eye images.
