Abstracts

The global Non-contact Test Pencil market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The non-contact electric pen uses an I-shaped inductor as an antenna, and several three-stage tubes are combined into an amplifier circuit. One end of the inductance is connected to the B pole of the triode, and the other end is suspended in the air. When the inductor is close to the live wire, a weak current is induced. After being amplified by the triode, the LED is lit and the buzzer sounds, so as to determine the zero live wire. The non-contact electric pen uses inductive testing without physical contact to check the voltage on control lines, conductors and sockets or to check the location of open circuits along the wires.

This report studies the global Non-contact Test Pencil production, demand, key manufacturers, and key regions.
