Abstracts

The global Non Corrosive Fluxes market size is expected to reach \$ 937 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

Non-corrosive flux refers to a type of flux that cleans the metal surface during the soldering process, but whose residues do not cause corrosion or damage to electronic components or circuit boards after soldering. It typically has low activity and leaves transparent, soft residues. Its upstream products mainly include high-purity modified rosin (such as hydrogenated rosin), film-forming agents, activators, solvents, and various functional additives. In 2024, global sales were approximately 85,000 tons, with an average market price of approximately US\$8,043 per ton. The industry's gross profit margin is in the range of 20%-35%.

As terminal applications migrate to higher reliability scenarios such as automotive electronics and industrial control, and driven by regulations and customer specifications favoring low-halogen/halogen-free and low-VOC materials, solder paste formulations are evolving from traditional rosin-based, high-solids content to low-solids content, low-halogen, and more stable residue formulations. Especially in the automotive electronics and high-reliability industrial sectors, no-clean, non-corrosive flux is gradually replacing traditional cleaning processes to reduce energy consumption and improve environment. This report studies the global Non Corrosive Fluxes production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Non Corrosive Fluxes and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2025 as the base year.
