Abstracts

The global Non-Essential Amino Acid (NEAA) Cell Culture Supplements market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Non-Essential Amino Acid (NEAA) refers to amino acids that can be synthesized by the human or animal body through its own metabolic pathways, so it is not 'essential' to some extent through dietary intake. In cell culture, adding non-essential amino acids can provide a more complete amino acid composition, promote cell growth and proliferation, and improve cell culture conditions. This may have a positive impact on certain types of cells and under certain culture conditions.

Common NEAA cell culture additives include serine, glycine, aspartic acid, glutamic acid, etc. These amino acids play an important role in the culture of many cell types and can also reduce changes in amino acids in the culture medium to a certain extent, thereby providing a more stable culture environment.

Non-Essential Amino Acid (NEAA) Cell Culture Supplements is a nutrient commonly used in in vitro cell culture. In the process of in vitro cell culture, it is usually necessary to provide the nutrients required by the cells to maintain their normal growth and metabolism. Although most animal cells can synthesize all amino acids, in actual cell culture, it is sometimes necessary to add non-essential amino acids to the culture medium.
