## Abstracts

Non-Hodgkin lymphoma (NHL) is a condition where abnormal lymphocytes are produced in the human body. These lymphocytes do not die and keep growing and dividing within the body unless treated. NHL is generally located at lymph nodes, however, if not treated in time then it might spread to the entire lymphatic system.

Scope of the Report:

Factors such as demand for innovative drugs and novel technologies, FDA's approval for chronic lymphocytic leukemia therapy drugs, introduction of promising drugs such as novel small molecule inhibitors and next-generation monoclonal antibodies, and increase in prevalence of NHL drives the market growth.

However, high cost of the vaccines used in NHL therapy and side-effects associated with them restrain the market growth.

Moreover, introduction of newer biologics in the NHL market, patent expiry of standard drugs in untapped market provide numerous opportunities regarding healthcare in near future.
