According to our (Global Info Research) latest study, the global Non-Insulated Blade Terminal market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A Non-Insulated Blade Terminal is an electrical connector designed to connect a wire to a screw or terminal block without any insulation protection. The terminal features a flat, blade-shaped metal component, typically made of copper, brass, or steel, that provides a secure electrical connection. These terminals are widely used in environments where insulation is either provided externally (like inside an electrical enclosure) or is unnecessary due to the specific application requirements. While non-insulated blade terminals provide an efficient and durable connection, they are not suitable for environments where exposed metal poses a risk of short circuits or electrical shock, making them best for controlled settings.
