Non-intrusive ultrasonic flow measurement is a technique used to measure the flow rate of liquids within a pipe without the need for any physical intrusion or alteration of the pipe system. This method employs ultrasonic transducers that are clamped onto the exterior of the pipe, sending and receiving ultrasonic signals through the pipe wall and the liquid. By analyzing the time it takes for the ultrasonic waves to travel through the liquid, the flow rate can be accurately determined. This technique is advantageous due to its ease of installation, maintenance-free operation, and the ability to measure flow in pipes of various sizes and materials without disrupting the flow process.
