The global Non-Invasive Brain-Computer Interface Device market size is expected to reach \$ 11610 million by 2029, rising at a market growth of 17.7% CAGR during the forecast period (2023-2029).

Non-Invasive Brain-Computer Interface (BCI) devices are a type of technology that can measure and interpret brain activity without the need for surgical implants in the head. These devices typically use electrophysiology techniques such as electroencephalography (EEG) or functional near-infrared spectroscopy (fNIRS) to capture brain signals, allowing users to interact with external devices through brain activity. With the expansion of applications, the security and privacy issues of brain-computer interface technology will become the focus, promoting the formulation of relevant standards and regulations. The future development of non-invasive BCI devices will focus more on technological innovation, expansion of application scenarios and improvement of user experience. These trends will promote brain-computer interface technology to be more widely integrated into people's lives and work.
