## Abstracts

The function of the brain is mainly studied by using techniques such as EEG or functional MRI. Brain stimulation method is also used to study the activity of the brain. The brain stimulation method comprises of repetitive Transcranial Magnetic Stimulation (rTMS) and Transcranial Current Stimulation (tCS). These two techniques are used to disrupt the activity of the brain as well as it is used to enhance the brain function. These two techniques are collectively known as non-invasive brain stimulation. The transcranial magnetic stimulation refers to the generation of magnetic pulses that easily transfers to the skull and other matter in the brain. The electrical potential are generated in brain, depolarizing the neurons and trigger action potentials. The tCS involves the direct or alternating current, the pair of electrode are placed over the head and one is placed over the target brain area.

According to our (Global Info Research) latest study, the global Non-invasive Brain Stimulation System market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.
