According to our (Global Info Research) latest study, the global Non-invasive Sugar Monitor market size was valued at US\$ 68.9 million in 2024 and is forecast to a readjusted size of USD 84.9 million by 2031 with a CAGR of 3.0% during review period.

A non-invasive sugar monitor is a device designed to measure the sugar content of fruits and vegetables without necessitating direct contact or cutting into the produce. Unlike traditional glucometers that require a liquid sample, these monitors work by shining specific wavelengths of light onto the produce's surface and measuring light attenuation to gauge sugar levels.

These monitors are invaluable in agriculture for assessing the ripeness and sugar content of crops without damaging them, making them especially useful for fruits that are sold whole, like melons or pears. Their non-destructive nature allows for direct measurements of shipped products, providing accurate sugar content readings.
