Abstracts

The global Non-Latching Power Relay market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Non-latching relays have only one stable position - the 'off' or de-energized position. They will remain in this unpowered state, not receiving power. Most power relays are monostable relays with a neutral coil system. When electricity passes through the coil circuit, the relay switches to the energized position. An internal coil creates a magnetic force that holds the energized position. When power is turned off, the relay returns to the de-energized position.

This report studies the global Non-Latching Power Relay production, demand, key manufacturers, and key regions.
