## Abstracts

According to our (Global Info Research) latest study, the global Non-Latching Signal Relay market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The non-latching signal relay is a relay corresponding to the latching signal relay. Unlike latching signal relays, non-latching signal relays require a continuous control signal to maintain their state, otherwise they will return to the default state. Non-latching signal relays usually consist of a control coil and multiple contacts, similar to conventional relays. When the control coil receives a control signal, the contacts switch to the desired state and remain in that state. However, once the control signal is stopped or lost, the non-latching signal relay will return to the default state, that is, the contacts will return to the initial state. Non-latching signal relays find widespread use in many applications, especially where continuous control and state changes are required. They can be used in a variety of applications such as control switching, signal transfer, logic control, and circuit switching.
