Abstracts

The global Non-Latching Signal Relay market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The non-latching signal relay is a relay corresponding to the latching signal relay. Unlike latching signal relays, non-latching signal relays require a continuous control signal to maintain their state, otherwise they will return to the default state. Non-latching signal relays usually consist of a control coil and multiple contacts, similar to conventional relays. When the control coil receives a control signal, the contacts switch to the desired state and remain in that state. However, once the control signal is stopped or lost, the non-latching signal relay will return to the default state, that is, the contacts will return to the initial state. Non-latching signal relays find widespread use in many applications, especially where continuous control and state changes are required. They can be used in a variety of applications such as control switching, signal transfer, logic control, and circuit switching.

This report studies the global Non-Latching Signal Relay production, demand, key manufacturers, and key regions.
