## Abstracts

According to our (Global Info Research) latest study, the global Non-metallic Mineral Processing Collector market size was valued at US\$ 709 million in 2024 and is forecast to a readjusted size of USD 985 million by 2031 with a CAGR of 4.8% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Non-metallic Mineral Processing Collectors are a type of agent that can selectively adsorb on the surface of minerals during the flotation process of non-metallic minerals, making the mineral surface hydrophobic and thus improving the floatability of the minerals. Collector molecules are generally composed of polar groups and non-polar groups. Polar groups can selectively adsorb on the surface of minerals, while non-polar groups face outward, making the surface of minerals change from hydrophilic to hydrophobic, so that mineral particles can attach to bubbles and achieve separation from gangue minerals.

In the actual non-metallic mineral beneficiation process, it is necessary to comprehensively consider and select appropriate collectors based on factors such as the nature of the ore, the beneficiation process and product requirements, and optimize the agent system through experiments to achieve the best beneficiation effect.
