According to our (Global Info Research) latest study, the global Non-opioid Pain Patch market size was valued at USD 649.7 million in 2023 and is forecast to a readjusted size of USD 771.6 million by 2030 with a CAGR of 2.5% during review period.

A non-opioid pain patch is a medicated adhesive patch that is placed on the skin to deliver a specific dose of medication through the skin and into the bloodstream. Often, this promotes healing to an injured area of the body. An advantage of a transdermal drug delivery route over other types of medication delivery such as oral, topical, intravenous, intramuscular, etc. is that the patch provides a controlled release of the medication into the patient, usually through either a porous membrane covering a reservoir of medication or through body heat melting thin layers of medication embedded in the adhesive.
