According to our (Global Info Research) latest study, the global Non-recombinant Coagulation Factors market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Non-recombinant coagulation factors refer to coagulation factors synthesized by the human body itself, which are different from coagulation factors synthesized through genetic recombination technology (recombinant coagulation factors). These coagulation factors are synthesized by the liver and other tissues of the human body under normal circumstances and play an important role in the coagulation process, helping to stop bleeding and maintain blood coagulation balance. Non-recombinant clotting factors are usually obtained from blood donations from healthy people.
