The global Non-recombinant Coagulation Factors market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Non-recombinant coagulation factors refer to coagulation factors synthesized by the human body itself, which are different from coagulation factors synthesized through genetic recombination technology (recombinant coagulation factors). These coagulation factors are synthesized by the liver and other tissues of the human body under normal circumstances and play an important role in the coagulation process, helping to stop bleeding and maintain blood coagulation balance. Non-recombinant clotting factors are usually obtained from blood donations from healthy people.
