According to our (Global Info Research) latest study, the global Non-Superconducting Magnetocardiography System market size was valued at US\$ 18.63 million in 2025 and is forecast to a readjusted size of US\$ 29.58 million by 2032 with a CAGR of 7.6% during review period.

Non superconducting magnetocardiography is a high-end diagnostic device based on room temperature magnetic sensing technology for non-invasive detection of weak magnetic fields in the heart. It usually uses an optical pump magnetometer or other high-sensitivity room temperature magnetic sensing solutions. Compared with superconducting systems, it does not require low-temperature cooling and complex shielding, and has more friendly installation and operation conditions, making it more suitable for clinical promotion and application. Based on existing data, the global sales of non superconducting magnetocardiography instruments are estimated to be around 23 units by 2025, with an average unit price of approximately \$787000. Due to limitations in system integration complexity and core sensor supply, the industry's overall capacity utilization rate is expected to be around 68%. Upstream enterprises are mainly distributed in the fields of high-sensitivity room temperature magnetic sensors, precision optical devices, low-noise electronic and signal processing chips, magnetic shielding materials, etc., while downstream enterprises are concentrated in the fields of medical equipment manufacturing, clinical system integration, and hospital delivery services, with an overall gross profit margin of about 35% to 48%. In the product cost structure, core magnetic sensors and optical systems account for about 40% of the total cost, electronic and algorithm hardware account for about 20%, system integration and assembly account for about 20%, research and development testing accounts for about 10%, and sales and after-sales service account for about 10%. According to parameters

and configurations, non superconducting magnetocardiography can be classified into single channel and multi-channel systems, fixed and semi mobile systems, as well as different configuration versions for scientific research and clinical screening. In terms of demand, the downstream demand list includes early screening for arrhythmia and cardiomyopathy in large hospitals, monitoring of cardiac function in newborns and children, evaluation of cardiac inflammation and drug cardiac safety, construction of regional cardiovascular diagnosis and treatment centers, and research on biomagnetism in universities and research institutions; The downstream customer list mainly includes cardiology departments of tertiary hospitals, specialized cardiac hospitals, medical research institutes, and high-end physical examination and functional medicine centers. In terms of business opportunities, policy drivers are reflected in the continuous strengthening of early diagnosis and screening of cardiovascular diseases and support for the localization of high-end medical equipment. Technological innovation drivers are focused on improving the sensitivity of room temperature magnetic sensing, the maturity of multi-channel array algorithms and artificial intelligence assisted interpretation, and changes in consumer demands are reflected in the significant increase in clinical attention to non-invasive testing, controllable operation and maintenance costs, and higher cost-effectiveness solutions. These factors together promote non superconducting magnetocardiography to become the most important incremental direction in the magnetocardiography market in the coming years.
